

## Wide Infindry filter Holding Frame

The Wide IFD HF Holding frame is a key component in the Wide INFINIDRY Air Intake System: The holding frame is a unique design to provide important properties for the Wide Drop Safe filter installation:

- Fully welded AISI316L 1,5 mm thick sheet metal frame for a robust design.
- Robust locking levers that are easy to operate and NOT possible to detach or loose.
- Locking levers provide firm gasket seal in the critical bottom drain area.
- Integrated drip tray and channel arrangement for collected water drain, meeting Statoil TR1562 requirements (avoiding water carry-over from filter row to next row).
- Gasket is installed on filter, thereby providing a new gasket for each filter replacement.
- Firm centering and positioning of the filter frame protect against installation problems
- Modular design for bolting together in "chessboard" style frame arrangements
- Gas Turbine Main Air Intake safe design: All bolts are upstream of filter.
- Available in full size and half width sizes.
